Abstract of WO0178430

The invention proposes a method for conveying an Adaptive Multi-Rate (AMR) codec stream between a first codex and a second codex over a network, comprising the steps of transmitting AMR frames via a Real-Time Transport Protocol (RTP) stream, and transmitting an AMR control signal via a Real-Time Transport Control Protocol (RTCP) stream. Thus, an easy control of the AMR codec stream via UMTS or IP networks is possible.
